📋 *INSTRUCTOR NOTE: This is the START screen. Click the button to begin the prototype.*

Example Clickable Prototype

Brew & Go
Coffee Shop Ordering App

Persona: Maya, a busy grad student ordering her usual drink before class.
This prototype shows the most important interaction: placing a customized order.

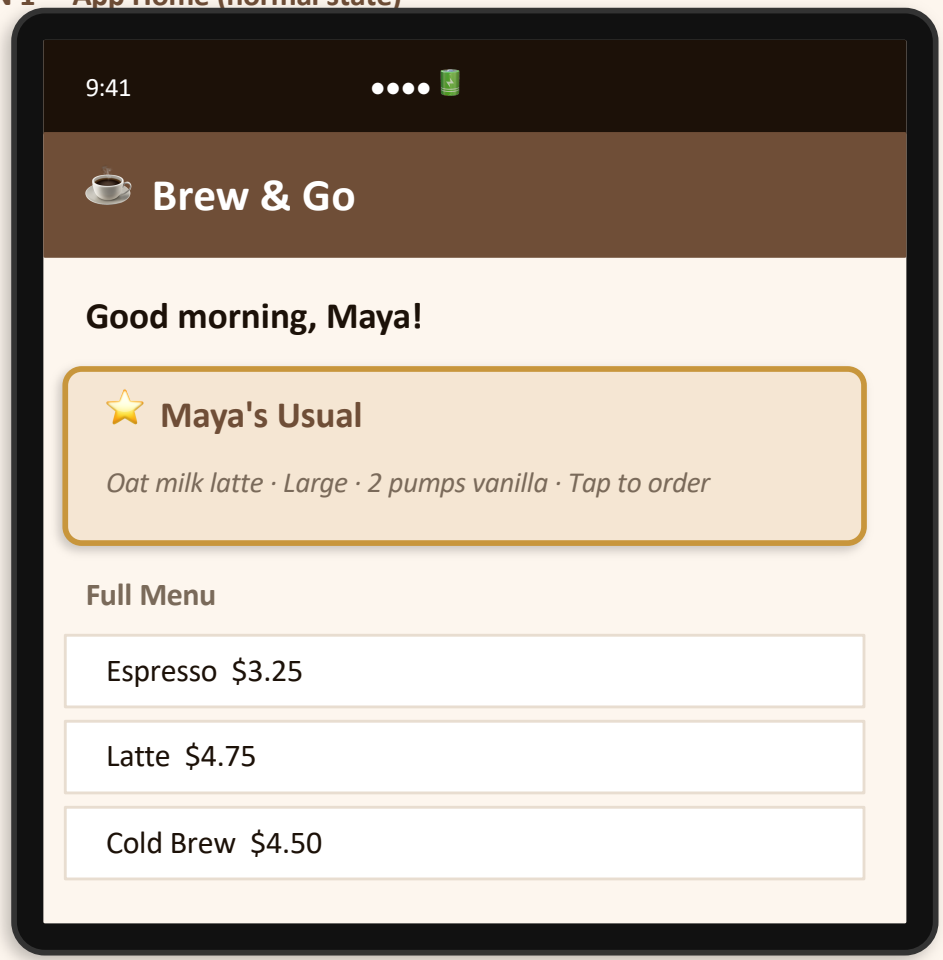
5 linked screens · Click buttons to navigate · No visual polish required

☕ **Start Prototype**

← *In your prototype, this would be your system's home or launch screen*

📋 *INSTRUCTOR NOTE: Screen 1 of 4. App home screen. Maya sees her 'usual' and taps it. Click the 'Maya's Usual' button.*

SCREEN 1 · App Home (normal state)



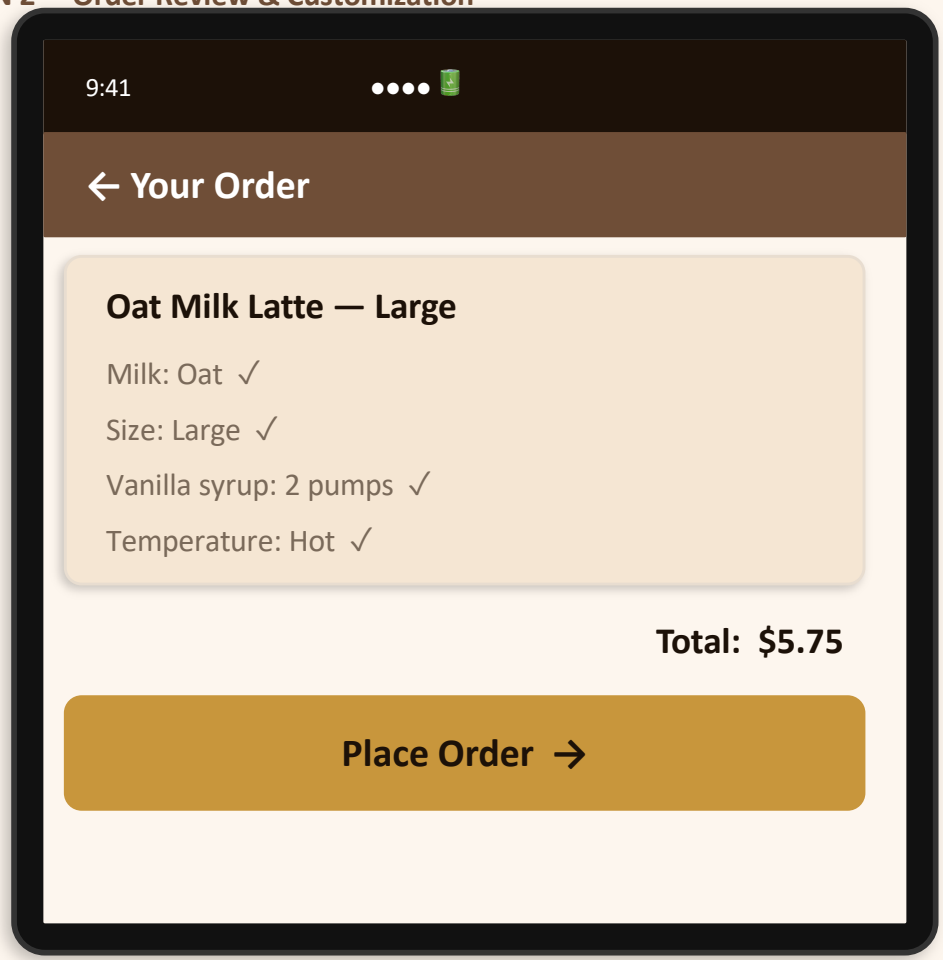
What this screen shows:

- Maya sees a personalized greeting and her saved 'usual' order
- The system has remembered her preferences — no need to rebuild her order from scratch
- The 'usual' card reduces cognitive load: one tap instead of navigating menus
- Other menu items exist but are not the focus of this prototype path

⬆️ **The 'Maya's Usual' card is CLICKABLE**
It links to Screen 2

📋 *INSTRUCTOR NOTE: Screen 2 of 4. Maya reviews her order and can customize it. She taps 'Place Order'. Click the green button.*

SCREEN 2 · Order Review & Customization



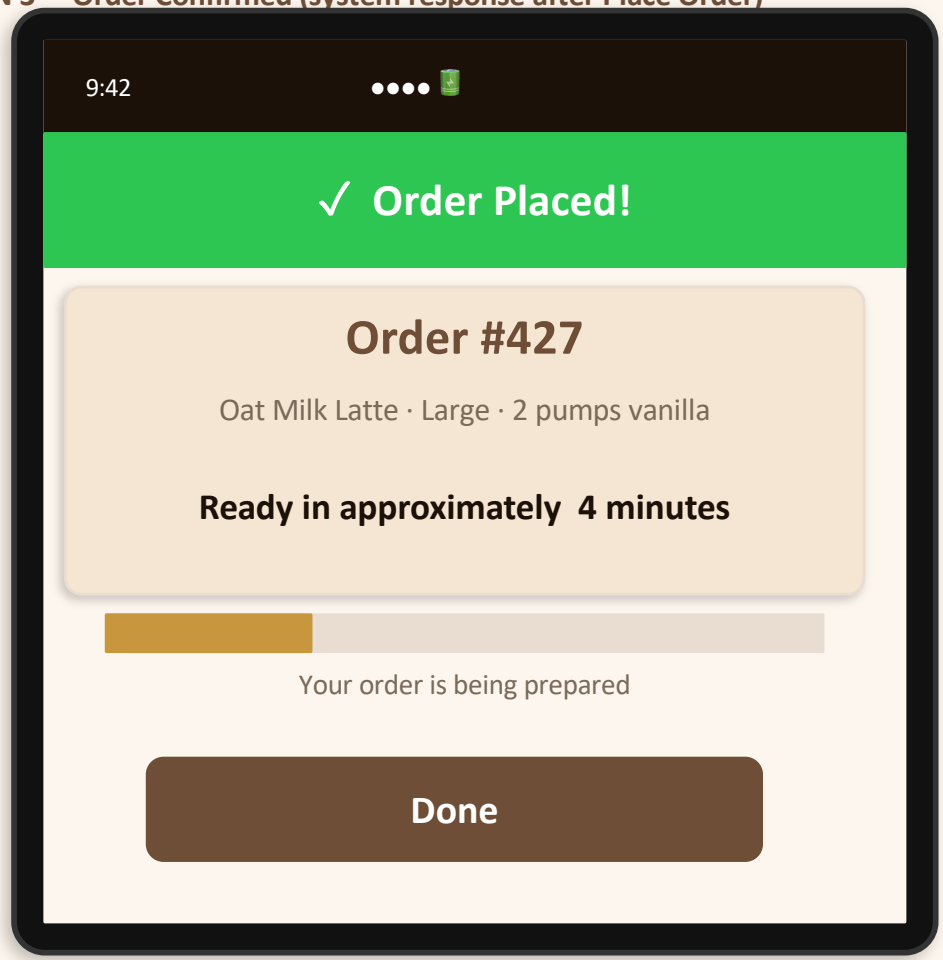
What this screen shows:

- System pre-fills her order from saved preferences — she doesn't rebuild it
- Each item is clearly labeled so she can scan quickly before confirming
- She can see the total before committing — no surprises at checkout
- One clear action: Place Order. The path is unambiguous.

⬆️ **'Place Order' is CLICKABLE**
It links to Screen 3

📋 *INSTRUCTOR NOTE: Screen 3 of 4. Order placed. System confirms and shows estimated wait time. Click 'Done' to finish.*

SCREEN 3 · Order Confirmed (system response after Place Order)



System response:

- System confirms with a clear visual signal — green banner, order number
- Wait time is shown immediately — Maya knows when to head to the counter
- Progress bar gives her a sense of where her order is in the queue
- Emotional design: reassurance, not just confirmation

⬆️ **Click 'Done' to see the prototype summary screen**

INSTRUCTOR NOTE: Summary slide. Use this to debrief what students should notice about how the prototype was built.

What This Prototype Demonstrated

Clickability

Every active button led somewhere. Home card → Order screen. Place Order → Confirmation. Done → Summary. That is what makes it a prototype and not a presentation.

↔ User + System

Each screen showed both sides. User taps 'Place Order' — system responds with confirmation, order number, and wait time. The system is not passive. It acts, confirms, and reassures.

◎ Focused Scope

This prototype covered one persona (Maya) and one interaction path (order her usual). The full menu exists but wasn't built out. Depth over breadth — 4 screens done well beats 12 screens half-finished.

Your prototype does not need to look like this. It needs to work like this.
